

System Enhancement & Bug Fix Report

Libas Alanwar • Point of Sale & Inventory Module Updates

CLIENT NAME
Libas Alanwar

REPORTED BY
Khadija

DATE ISSUES RAISED
August 24, 2026

ACTION STATUS
Pending Action

Executive Summary

Based on feedback provided by **Khadija** today, four primary operational limitations and technical issues have been identified in the Libas Alanwar system. Addressing these gaps will optimize invoice workflows, eliminate product duplication, enable clear catalog search options, and restore real-time inventory tracking visibility for operational efficiency.

System Enhancements & Technical Action Items

1 Quick-Add "Client" Button in Invoicing Section

CURRENT OPERATIONAL ISSUE

Operators cannot add new client profiles directly while working within the invoice screen, leading to workflow interruptions when completing transactions for first-time customers.

REQUIRED ENHANCEMENT

Integrate an **"Add Client"** modal button inside the invoicing module to allow instant client record creation without leaving or resetting the active invoice view.

2 Item Variation Matrix (Sizes / Collections)

CURRENT OPERATIONAL ISSUE

Items with identical pricing but varying sizes currently have to be registered as separate standalone products, resulting in heavy database redundancy and bloated catalogs.

REQUIRED ENHANCEMENT

Implement a **Variation Option** under collections, permitting a single base product entry to house multiple size variants while keeping individual quantity tracking intact.

3 Inventory Visibility Restoration

CURRENT OPERATIONAL ISSUE

The stock management/inventory module currently displays no items ("shows nothing"), blocking the management team from viewing stock levels or monitoring reorder thresholds.

REQUIRED ENHANCEMENT

Debug and re-establish backend data queries to accurately present active stock availability, low-stock indicators, and variant-level quantities across the system.

4 Collection-Based Item Selection on Invoices

CURRENT OPERATIONAL ISSUE

Invoicing item search is limited and disconnected from category structures, making item selection during sales line creation slow and inefficient.

REQUIRED ENHANCEMENT

Enable direct item and variant selection from structured **Collections** within the invoice creation interface to streamline line-item entry.

Implementation Plan & Next Steps

- 1. Database & Schema Refactoring:** Update item architecture to support parent products and nested variants (sizes/ colors).
- 2. UI/UX Interface Updates:** Build the quick client creation modal and line-item collection picker inside the invoice layout.
- 3. Backend & Query Optimization:** Resolve data binding issues on the inventory module to restore live stock views.
- 4. QA & Verification:** Perform end-to-end testing with Khadija's team to confirm resolution across invoicing and inventory sync.
